

SPACEKIT · BY SWITCH.AI

The AI-native Layer 1 and the operating system built on it.

Smart contracts call AI inference natively. Apps and agents ship as signed file packages.
Post-quantum identity, storage & messaging. Every user is a DID.

“Like an AI operating system and Lovable had a baby, in a quantum-safe laboratory.”

Live testnet · Production agents · First-party micro-apps · Pre-mainnet

INVESTOR PRESENTATION · 2026

AI builds software in minutes. There's nowhere safe to ship it.

Existing L1s predate AI. Web2 platforms extract from creators. And everything encrypted today is quantum-exposed tomorrow.

AI ON EXISTING L1s

No native inference

Smart contracts can't call AI directly. Inference happens off-chain via oracles — unverifiable outputs, high latency, prohibitive gas.

AI ON WEB2 PLATFORMS

Creators rent everything

Models live behind APIs. Platforms own distribution, set the economics, and take 30–45% — creators can't own or monetize their work directly.

VIBE-CODED APPS

No rails to production

Claude and Codex generate working apps every day — increasingly built by people who have never deployed anything — with no identity, signing, payments, or distribution layer to ship them safely.

QUANTUM RISK

Harvest now, decrypt later

Every major chain runs on RSA/ECDSA. Content encrypted today will be readable when quantum computers arrive — migration is costly and unsolved.

AI-native applications need a chain — and an app layer — designed for them. None of the existing L1s was.

Make AI a first-class primitive — and apps a first-class asset.

Not bolted on. Not an oracle. Inference equal to an ERC-20 transfer; apps as signed, ownable, tradable packages.

THE THESIS

AI inference as a smart contract primitive. Software as signed file packages.

Bounded outputs · Post-quantum signed · Callable from any contract · Deployable by anyone

AI-NATIVE

Inference is a contract primitive — not an oracle, not an off-chain integration.

QUANTUM-SAFE

Post-quantum on the durable path: SPHINCS+ identity, Kyber-encrypted storage, PQ messaging. Dilithium2 already signs consensus votes.

CREATOR-FAVORABLE

DID ownership, direct monetization, 95% to operators. Distribution without gatekeepers.

Three properties no existing Layer 1 has all of. We built it.

One network, two layers; servers to browsers.

A Rust L1 for operators. An isomorphic JS L2 that runs the same contracts in Node, Bun, mobile, and the browser.

1

L1 · CONSENSUS

DID-trust + scaling slash

Operators are post-quantum DIDs (SPHINCS+); consensus votes are Dilithium2-signed today. Reputation-weighted thresholds activate by governance at mainnet, slash exposure scales with earned trust, not raw stake.

2

L2 · RUNTIME

SpaceKit-JS, everywhere

A full node in JS/Node/Bun and the browser, MetaMask-compatible ECDSA signing and EIP-1193 dApp plumbing for immediate distribution. The same WASM contracts run isomorphically and call AI inference natively via host primitives.

3

STORAGE

Quantum-resistant verkle trees

Authenticated, content-addressed storage with SIS-based commitments and encrypted blobs. Secure against harvest-now-decrypt-later; designed for long-lived content.

4

SKCL · CONTRACT LANGUAGE

Safe composition via macros

Rust-based macro system: contracts import inference, encrypted storage, messaging, and payments as one-line primitives. Ships with a 25+ contract Standard Library.

Every layer designed for AI from the start — not retrofitted onto a pre-AI chain.

DeFi primitives and AI primitives; equal-citizen imports.

25+ contracts across 6 categories. The OpenZeppelin equivalent for an AI-native chain. Open source: github.com/spacekit-xyz/spacekit-standard-library

TOKENS & FINANCE

- sk-erc20 / 721 / 1155
- sk-erc8004 (agent standard)
- escrow · payment-router · paymaster

AGENTS & AI

- spacekit-agent (chat / analyze / review)
- growformer sentiment models
- routekit-agent · inference-mesh

IDENTITY & ACCESS

- spacekit-did-registry
- session-keys (delegation)
- shared-vault · access-control

MARKETPLACE

- app-store (distribution + licensing)
- entitlement-ledger
- reputation · intent-classifier

STORAGE

- sk-storage-box (blob / store)
- sk-video-tube (video + metadata)
- compression-service

DISCUSSION & FORUMS

- spacekit-spacetime (forum)
- custom verticals via SKCL
- composable across categories

The first L1 where an ERC-20 transfer and a bounded AI agent are the same kind of import.

What users see: an operating system, not a chain.

Every user is a DID with a profile, feed, and wallet. Apps ship into a social graph not an empty app store.

Identity-anchored distribution, built into the protocol.

- DID identity + SpaceKit profile
- Feed: posts, reposts, saved
- Discover: apps, agents, creators
- Wallet & payments, native

FIRST-PARTY MICRO-APPS — LIVE ON THE NETWORK

News

curated, on-chain

Messages

encrypted, DID-to-DID

Files

encrypted blob storage

Notes

private, portable

CRM

creator business tools

Games

vibe-coded · paid in ETH/USDT/USDC

Distribution is built in: every app launches into a feed of DIDs, not a cold start.

From vibe-coded to shipped: the .spkg pipeline.

Take a webapp built by Claude, Codex — any AI tool — and turn it into a signed, monetizable product in four steps.

Already live: vibe-coded games deployed to the network, charging users in crypto. The same rails carry every future vertical — agents, video, data, dApps.

Any AI agent can operate the network. Natively, over MCP.

Every node speaks Model Context Protocol. Claude, Cursor, or any MCP client gets first-class hands on SpaceKit.

spacekit-storage-node

Storage as versioned tools

Transactions, sandboxes, workspaces, blob replication, and graph traversal exposed as *.v1 MCP tools over JSON-RPC / stdio.

spacekit-compute-node

The chain as 10 tools

Deploy and call WASM contracts, fund accounts, submit transactions, mine and query blocks, fetch receipts, the full SwtchVM surface.

spacekit-gateway

One endpoint, merged catalog

Aggregates storage + compute backends, merges their tool catalogs, and serves MCP over HTTP and stdio. Wired automatically by the CLI supervisor.

WHERE HUMANS + AGENTS BUILD TOGETHER

Repositories: a GitHub-class code host where commits are DID-signed and repos are quantum-safe encrypted.

Workspaces: shared build environments where people and agents co-develop, then ship straight to .spkg.

The agent economy needs a chain it can actually use. SpaceKit is operable by agents end-to-end, today.

The SpaceKit Agent Factory: Powered by Growformer.

A self-organizing neural substrate that grows models to fit the task, MNIST-scale micro-brains to full domain brains, shipped as WASM that runs anywhere SpaceKit-JS runs, including the browser.

GROWN, NOT TRAINED

Structure is the model

Neurons have position and mass; synapses form, strengthen, and dissolve. Topology itself is learned — knowledge consolidates as physical structure, then freezes intact.

CONTINUAL LEARNING

New skills, zero forgetting

Each new task grows in a fresh mirror substrate, then promotes into the main graph. Frozen tasks are untouched: 97.7% across 5 sequential Split-MNIST tasks, 0% forgetting.

RUNS WHERE USERS ARE

Narrow AI in the browser

Compiled to WASM, executing in JS on the client. A 4.4 MB model screens cancer pathology CPU-only — no GPU farm between a model and its user.

THE FACTORY LOOP

Grow a brain in the Agent Factory → package as a signed .spkg agent → deploy to the network → monetize via SpaceKit Pay. **The chat and sentiment agents in production today came off this line.**

One substrate, every scale: chat, sentiment, vision, models sized to the job and owned by their creators.

Shipped: the chain, the agents, and the first apps.

Pre-mainnet. The technology is real, the agents are live, the apps are running. Next milestone: operator-side participation.

5

production agents

chat + fintech & crypto sentiment, live
at spacekit.xyz/agents

6

first-party micro-apps

News, Messages, Files, Notes, CRM +
Games — on testnet

19

post-quantum algorithms

integrated across identity (SPHINCS+),
storage, and messaging (KEM suites)

75%

Good Web Vitals (LCP)

sub-2s loads while running a full
SpaceKit-JS node in-browser

97.7%

Continual learning — 5 Split-MNIST tasks, 0% forgetting.
Architecture-level, not a training trick.

78.7%

Cross-site cancer screening (PathMNIST) — 4.4 MB model,
CPU-only, no fine-tuning.

AI agents are the hardest content type, executable code that must be safe on someone else's machine. We ship them in production.

Certik full-system audit already underway, this raise funds completion, mainnet, and the CLI release.

Three waves crossing. One protocol serves all three.

Total markets are large; the wedge we capture is specific — creators and agents monetizing signed, transferable digital content.

CREATOR ECONOMY

\$200B → \$1.3T+

2025 → 2033 (Grand View, FMI)

Substack, Patreon, OnlyFans proved direct creator-buyer relationships. Next wave: ownership and portability of the content itself.

AI AGENT MARKET

\$7–8B → \$150–230B

2025 → 2033 (38–49% CAGR)

The fastest-growing of the three. Inference is now a CFO line item; per-call economics replaces subscription pricing.

RWA TOKENIZATION

\$30B → \$60B+

Q3 2025 on-chain → 2034 forecast

Real estate, treasuries, and commodities proved the mechanic. Digital content is the next category, same primitive, different payload.

THE CONVERGENCE Micro-apps are the AI-era spreadsheet, software creation for the 95% who don't code. We don't need the whole creator economy; we're the rails under its long tail.

Creators monetize directly. The protocol takes 5%.

Three primitives, one job each. Investors own the company and its stable coin fee stream, not a token.

95%

to operators — SpaceKit Pay routes buyer stablecoins directly, non-custodial, zero contract balance after settlement

5%

flat fee to SWTCH treasury — paid in stablecoins. This is software fee revenue owned by equity investors.

SpaceKit Pay

for buyers

Non-custodial routing of USDC / USDT / DAI: On Ethereum, Base, Polygon, Arbitrum, Optimism + SpaceKit. Atomic 95/5 split per payment.

ASTRA

for operators

Fixed 2B supply, no inflation. Gas, validator stake, governance. Earned only by operating infrastructure, emissions halve every 4 years. No public sale, ever.

x402

for machines

HTTP-native 402 pay-per-call standard for agent-to-agent commerce. SpaceKit Pay is a settlement rail. No subscriptions, no API keys.

Compare: Apple 30% · YouTube 45% · App Store 30%. SpaceKit Pay's flat 5%, in stable coins, straight to company revenue.

Shipped. Building. Next.

SHIPPED

Already live

- Quantum-resistant L1 testnet with verkle-proof commitments
- SpaceKit Agent: Algebraically bounded outputs, CPU-only
- Production agents at spacekit.xyz/agents
- Micro-apps: News, Messages, Files, Notes, CRM + games paid in crypto
- MCP across storage, compute, and gateway nodes
- Post-quantum identity, storage & messaging (SPHINCS+, Kyber KEM suites)

BUILDING

What this raise unlocks

- Mainnet launch: Third-party operator participation
- SpaceKit CLI release: Publishing workflow opens to the public
- Complete CertiK full-system audit (underway) + second firm; Cayman/BVI foundation
- .spkg Marketplace v1, agent vertical first

NEXT

Subsequent verticals

- Content Hackathon: Community-built micro-apps, games+npc, agents + pet-2-pet training
- Video: Decentralized streaming and on-demand publishing
- Data: Signed datasets, licensed access, on-chain payment
- Web: dApps and sites distributed as .spkg
- Tokenized claims:
- RWAs on the same primitive

Founder-built stack. Team of two today.

The founder is the protocol engineer — he built the entire stack end-to-end. Product management is already in-house.

Astor Rivera

Founder & CTO

Las Vegas, NV

+ Product Manager, in-house

TOKENIZATION (2019)

Founding CTO of RealT

First fractional residential real-estate platform on Ethereum. Substrate L1 prototype, smart contracts, Chainlink oracles, KYC/AML, on-chain dividends. Real users, real legal scaffolding, real production.

MEDIA AT SCALE (2006–2023)

Production systems for the biggest names

Disney, ABC, Warner Bros, Bloomberg TV, AEG. Multi-angle live streaming for The Oscars, BBC Live, Coachella — 15M+ concurrent viewers. The decentralized video research that became SpaceKit started here.

AI INFRASTRUCTURE (2022–PRESENT)

Designed & shipped SpaceKit

The SpaceKit Agent Factory (Growformer substrate) · post-quantum identity, storage & messaging · DID-trust consensus · SpaceKit-JS · the entire network stack, built solo.

Sole engineer by necessity, not philosophy — this raise adds four engineers around a working, audited stack.

Raising \$3M to ship mainnet — and hire the team to run it.

24 months of runway, milestone-mapped. Priced to close with a lead, not to anchor a negotiation.

USE OF FUNDS — MILESTONE-MAPPED

RAISING

\$3M

TERMS

Equity (SAFE) · \$20M valuation cap

Equity only — no token sale, no SAFT. You own SWTCH Labs + its 5% fee revenue.

RUNWAY

24 months — through mainnet, audits, and Marketplace v1

STRUCTURE

Wyoming entity (SWTCH Labs) · Withers Worldwide counsel · ASTRA utility opinion in progress

60%

Engineering team — four key hires

Protocol engineer (bus-factor) · security engineer · front-end/product engineer · DevRel & ecosystem lead. PM already on board.

15%

Security & audits

CertiK full-system audit (~\$250K, underway) + second-firm review before mainnet

10%

Legal & foundation

Cayman/BVI foundation, token framework, regulatory scaffolding

10%

Infrastructure

Operator bootstrap, networks, CI, browser-VM runtime hardening

5%

Ecosystem

Pets hackathon, grants, devrel content — first external .spkg publishers

Every dollar maps to a milestone: hires → audits → mainnet → CLI → Marketplace v1.

THE NEXT MILLION APPS WON'T COME FROM DEVELOPERS

Build with us.

Creators publish. Buyers pay directly. Agents build alongside you. The protocol does the rest.

Try the network right now: spacekit.xyz/agents
